

KEEPING ASD COVID-19 CLEAN

Daily sanitizing is an important part of how we keep our schools open and safe for students and staff.

WHAT WE USE:

We use Hypochlorous Acid (HOCL) which is a safe and very effective disinfectant. HOCL occurs naturally in the human body; it is released by white blood cells to fight infection. It works by creating available free chlorine, very much like bleach. It is better than bleach for killing germs. It's significantly more stable and non-toxic. HOCL is used to sanitize fresh vegetables, treat water, wash hands and even for wound care, depending on its strength.

CHAMPIONS IN KEEPING OUR SCHOOLS CLEAN:

- Teachers have access to battery powered and manual cleaning materials to clean and sanitize daily and between classes.
- Building Plant Operators (BPO) clean and sanitize bathrooms and fixtures daily.
- If needed, school administrators will work with BPO's to provide additional sanitizing for large spaces.
